

ProjectShare.com makes infrastructure investment to increase data capacity and application response time, as client needs scale.

7/24/2001 – Today Innovative Drafting Concepts, creators of ProjectShare.com, makes a sound business decision to increase its application and data warehousing capacity. Our regard to our customer's accessibility performance is a key to us. Our client base has grown rapidly since we opened doors to our ASP application in February 1999. ProjectShare.com has always received great client feedback on our outstanding application design, innovative deployment schemes and good application response time. Due to the vast amount of site activity, we knew soon a 'good application response time' would not be sufficient and good could diminish to fair and fair to poor.

To avoid these prohibited forecast, technically, we snapped in three new index servers to remedy entry point bottlenecks. Also, we partnered with MaximumASP to provision OC12 bandwidth. This bandwidth is about 6 inches of optical fiber that delivers data in a most reliable way. Geographically, we are housing our application in a data center that has low traffic due to the city's low bandwidth requirements. The servers are equipped with the latest application services technology. Thus allowing us to delivery a robust application with an 'always up and ready' reliability.

We felt all of these new enhancements were deemed, as it should be for our loyal customers and were the results of carefully managed systems and unrelenting customer care. In closing, our satisfied customers will further receive our applications even faster with more reliability.

- Micheal Hamilton, Technical Division
